

Since the company upgraded the interface recently, we are having some trouble with some phones, please bear with us as we try to sort issues out if you also experience them.

GPSWOX Basic Setup Instructions

We are now using the rebranded tracker system **GPSWOX**, the same reliable platform we've successfully used under the Tractalis name in previous events.

This is a change for our team and we are learning it too 😊.

These are **abbreviated setup instructions** to help you get started quickly.

If you need assistance, **call Brett directly on 0418 557 052**, I'm always happy to help, note I don't have an Android so difficult to direct you to specific settings.

Step 1: Find and Install the App

Track My Phone
GPSWOX

Search for “**Mobile Phone GPS Tracker**” in your app store, or use the direct links below:

Android:

 <https://play.google.com/store/apps/details?id=org.mobilegpstracker.client>

Apple:

 <https://apps.apple.com/us/app/mobile-phone-gps-tracker/id961000900>

(Note: I'm an iPhone user, so I may not be able to troubleshoot Android-specific issues, but hopefully there won't be any!)

Step 2: Select Server

When prompted, **choose the “ASIA” server.**

Step 3: Enter Your ID *(only after you have been advised it is ready)*

Use this format for your user ID:

LHR(firstname)(lastname initial)

Example:

If your name is *John Smith* → **LHR26johns**

If you receive an error or “wrong credentials” message, it may mean we haven’t set up your profile yet, or there’s a typo in your name.

Step 4: Test the Connection

Once logged in:

1. Enable tracker,
2. Go **outside for a 10min walk or run** for 1km to activate your GPS signal.
3. Before doing so, **check frequency** (default is 180).
 - This setting determines how often your position is updated.
 - **Android users:** Some devices may not allow changes below 180 seconds (or may default to 600). If you can change it, please do so, otherwise, leave as is.

Note tracker frequency can only be edited while tracker is disabled

Step 5: Confirmation

When you are about to test it, **send Brett a quick text** before your walk/run so he can confirm the signal is visible and working on his end, if unable to watch live, a report can be generated to see if the trace has worked.

That’s it, you’re good to go! 🏁

Good luck,
Brett
